REPORT

TO

The Right Honourable SIR GEORGE GREY, Bart., G.C.B., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

*General Register Office, Somerset House,
10th June 1857.*

SIR,

I HAVE the honour to submit to you, in continuation of my annual statements, the Abstracts of the Births, Deaths, and Marriages in England and Wales during the year 1855.

1855.—MARRIAGES, BIRTHS, AND DEATHS.

304,226 persons were married; the births of 635,043 children, not including the still-born, were registered; and 425,703 deaths were recorded during the year. Thus 1,364,972 new names were inscribed on the national registers. Respecting each of these persons, certain important facts are registered, which when carefully collated, throw light upon many subjects of great public interest.

The natural increase of the population by the excess of births over deaths in the year was 209,340; or it was at the rate of 1·121 per cent. on the population. The increase is greater than the annual increase of the two previous years by several thousands.

The number of marriages decreased; and the persons married were 15,228 less in number in 1855 than in the previous year. The number of births exceeded by 638 the 634,405 births in the previous year. The deaths were 12,202 less numerous than the deaths in 1854.

176,807 emigrants embarked from the ports of the United Kingdom during the year 1855. About 62,906 of the number were of English or Welsh origin, of whom 27,833 sailed to the United States, 4991 to the North American colonies, 29,868 to the Australian Colonies, and 214 to all other places. Of the 62,906 persons about 24,997 were adult males, and 22,545 adult females; 6769 were males aged 1 to 14 years, and 6470 were females aged 1 to 14; and 2125 were infants.*

* These results have been derived from the following numbers published in the Appendix to the Sixteenth Annual Report of the Emigration Commissioners.

Summary of Emigration from the United Kingdom, 1855.

Adults.		Children aged 1 to 14.		Infants.	Not stated.	Total.	Native Country of Emigrants.				
M.	F.	M.	F.				English.	Scotch.	Irish.	Foreigners.	Not stated.
65,363	58,950	17,700	16,919	5,557	12,318	176,807	57,132†	14,037	78,854	10,554	16,230

† Of this number of English, 25,278 sailed to the United States; 4,533 to North American Colonies; 27,127 to Australian Colonies; and 194 to other places. In the statement in the text the numbers which appear in this Table under the head of "Not stated" have been distributed proportionally over the other heads.

The annual rates of the year 1855 were such, that to 100 persons living*, there were marriages $\cdot 810$, persons married $1\cdot 620$, births $3\cdot 380$, deaths $2\cdot 266$. The rate of marriage was below the average; the rates of birth and of death were slightly above the average of the eighteen years 1838–55. *One* marriage took place to 123 persons living, and consequently *one* person was married to 62 living; *one* child was born alive to every 30 persons living; *one* person died to every 44 living.

The observations now extend over eighteen years; and the resulting average rates for England and Wales are to 100 persons living, $1\cdot 631$ persons married annually, $3\cdot 276$ births, $2\cdot 246$ deaths; or 1 in 61 of the population is married, 1 in 31 is born, 1 in 45 dies annually.

MARRIAGES.

127,751 marriages were celebrated according to the rites of the Established Church, and 24,362 marriages according to other forms. Of 100 marriages, about 84 take place in the churches and chapels of the Establishment. Only 14 marriages were by special licence; more than 20,386 by licence, 99,546 after banns, 3804 by superintendent registrar's certificate. The mode of marriages was not stated in 4001 instances by the clergymen. If we take the proportion in 100 on the 123,750 distinguished cases, $16\cdot 5$ were by licence, $80\cdot 4$ by banns, and $3\cdot 1$ by superintendent registrar's certificate.

The cost of the marriage licence is about 50s.; the common fee for the publication of banns is 1s. The revenue of the ecclesiastical officers under the two heads must have been about 52,613*l.* for licences, and 5138*l.* for the publication of banns.

The decrease in the marriages by banns was 5504 on 105,050, or more than 5 per cent.; the decrease in the marriages after licence was 662 on 21,048, or more than 3 per cent. The poorer classes evidently felt the

1855	18,786,914	152113	304226	635043	423703	209340

† The Population has been deduced on the assumption that the annual rate of increase was uniform; viz. $1\cdot 220$ per cent. in each of the 10 years 1841–51, and $1\cdot 326$ per cent. in each of the 3 years 1838–40. For 1852–55 the increase of Population has been obtained by taking the excess of births over deaths in the four quarters ending June 30th, in each year. The results, by the latter method, will probably be found now to be more correct than those deduced on the hypothesis that the population increased at the same rate in 1851–2–3–4–5, as it did in 1841–51.

* By taking the numbers living to be 100,000, the numbers may be read without the decimal points.

pressure of the times more severely than the rich; and they abstained from marriage to a greater extent.

The marriages in registered places of worship belonging to Roman Catholics were 7344; to Independents, Baptists, Methodists, and other Christian denominations 9296, to Quakers 57, and to Jews 224. The marriages among the Roman Catholics attained their maximum (8375) in 1853; they fell to 7344 in 1855, or more than 12 per cent. The number (10,149) among other Christian denominations not of the Established Church was at its maximum in the same year, and fell to 9296 in 1855, or 8 per cent.; while the marriages according to the rites of the Church of England declined 7 per cent. These rates must have been modified by the comparative wealth of the members of the different communities.

High prices of wheat depress marriage among the classes (five out of six) who marry by banns, to a greater extent than they depress marriage among the remaining sixth of the people marrying by licence. Consequently, as the annual average price of wheat was higher (74*s.* 8*d.*) in 1855 than it was in any of the 15 years since 1841, the proportion of marriages by *banns* to the marriages by *licence* should be lower than it was in any of those years. This is found to be the case, and the proportion was 4·883 marriages by banns, to 1 marriage by licence in 1855. The principle that was announced in the last report, is thus confirmed by the experience of another year. (See Table *a.*)

Marriages of minors.—8386 young men and 27,207 young women married under 21 years of age; of 100 men who married nearly 6 were minors, of 100 women 18 were minors; or taking 100 persons (50 men and 50 women), 12 married under 21 years of age.

1843	·759	5·490	·117	·642	50 1
1849	·808	5·429	·126	·682	44 3
1852	·872	5·472	·135	·737	40 9
1850	·860	5·666	·129	·731	40 3
1851	·858	5·591	·130	·728	38 6

The number of young women marrying under age has increased rapidly within the last seven years. The proportion fluctuated only from 13·16 to 13·73 per cent. in the seven years 1841-47. It then rose from 14·06 in 1848, and 15·75 in 1851 to 16·99 in 1852; 17·76 in 1853; 18·03 in 1854; and 17·89 in 1855. The proportion of young men to young women who marry under the age of 21 is as 1 to 3; but the early marriages of men increased nearly to the same extent as the early marriages of women.

The proportion of early marriages of women exceeded 20 in 100 in the following counties; and it was 21 in the county of Northampton, 24 in Huntingdon, 25 in Bedford, 23 in Cambridge, 21 in Essex; it was 28 in Stafford, 26 in Durham, and 22 in Monmouth, the great coal districts; 21 in Nottingham, 21 in Derby, 21 in Lancaster, 25 in the West Riding of Yorkshire, 21 in the East Riding of Yorkshire.

The *increase* of the proportional number of marriages of young women under the age of 21 was great in Cornwall, Durham, and Monmouthshire and Wales; in Herefordshire, Shropshire, and Worcestershire; in Nottinghamshire and Derbyshire; in the East Riding of Yorkshire, Northumberland, and Cumberland. And the increase was not only in the proportional, but also in the absolute number of such marriages. London, Middlesex, Devon, and North Wales have remarkably few marriages of minors.

Re-marriages.—21,940 widowers and 14,435 widows re-married; 14,280 widowers married spinsters, and 7660 married widows, and 6775 widows married bachelors. The proportional number of widowers (14·42 per cent.) and widows (9·49 per cent.) exceeded the average.

In London, Bucks, Norfolk, Wilts, Notts, Chester, Lancaster, the East Riding of Yorkshire, more than 15 in 100 men who married were widowers. In London, Hants, Hereford, Stafford, Warwick, Lancaster, Durham, and Monmouth, more than 10 in 100 women who married were widows.

Signatures of persons married.—44,846 husbands and 62,672 wives made their marks; while 107,267 husbands and 89,441 wives wrote their names in the marriage registers. A certain number of the women who

Mean . .	·816	1·631	3·276	2·246	123	61	31	45

NOTE.—The Table may be read thus:—In the year 1838 to every 100 persons living there were ·771 marriages or 1·542 persons married, 3·029 births, 2·238 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. By disregarding the decimal points the Table will show the proportion to every 100,000 persons living. A correction for increase of population has been made in calculating the above results.

make their marks are deterred by timidity from writing their names; upon the other hand many thousands of those who write their names, write very badly, and are evidently little practised in the art of writing. The means of education must still be deplorably defective in England and Wales, when we find 41 in 100 women, and 29 in 100 men making crosses instead of writing their names in the registers of their marriages. It is consolatory to find that within the fifteen years 1841 to 1855, the proportion of men who write their names has increased from 67·3 to 70·5; and the proportion of women has increased to a still greater extent; namely, from 51·2 to 58·8 in 100.

Each marriage constitutes a family; and to the family the fact that one of its members can read and write, is of more importance than the fact that both can read and write. Now as 107,267 men and 89,441 women wrote their names, it is evident that the 196,708 may have been so distributed in pairs, as to leave no pairs in which neither the husband nor the wife could write.

Such a combination, however, does not take place. But if it is assumed that the men and women who can write, and that the men and women who cannot write, have no tendency to intermarry greater than that which

disposes them to marry those who are not in the same class as themselves, it follows from a well-known mathematical formula* in the calculus of probabilities, that the 152,113 married couples would have been distributed as they are in the second column of the annexed Table.

	Numbers if no selection had existed.	Numbers as given in the registers.	Difference.
Husband AND wife write - -	63,072	76,734	+ 13,662
Husband OR wife writes (mixed } marriages) - - - - }	70,564	43,240	- 27,324
Husband AND wife do not write -	18,477	32,139	+ 13,662
(1)	(2)	(3)	(4)

Here the indisposition to mixed marriages is evinced in the fact, that instead of 70,564, there were only 43,240 couples in which *one* or other of the two could write ; half the difference of those numbers or 13,662 being added to the 63,072 couples in which both husband and wife write, and the other 13,662 to the 18,477, in which neither the husband nor the wife writes. As the poor intermarry, and the wealthy intermarry, so naturally the classes who cannot write intermarry ; and thus, instead of having the greatest number possible of cases in which at least *one* writes, there is not the due mathematical proportion of such cases, but in 32,139 of the new families, neither the father nor the mother will be able to write.

The number of married couples in England was about 3,150,470 in the year 1855. It is certain that at the date of their marriages, elementary

† The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

* Let *m* denote the number of men who are able to write their names, and *m'* the number of men unable to write their names; also let *f* denote the number of women able, and *f'* the number not able to write; then putting $\frac{m+m'}{f+f'} = \frac{M}{F}$ and multiplying the terms of the two equations into each other, we have $mf + m'f + mf' + m'f' = MF$
 $\therefore \frac{mf}{MF} + \frac{(m'f + mf')}{MF} + \frac{m'f'}{MF} = 1$

The first term gives the proportion of combinations in which both write, the second in which the man or the woman writes, the third the proportion in which neither writes.

education was less diffused even than it is in the present day, consequently the *proportion* of the cases in which neither the man nor the woman writes will be greater among these 3,150,470, than it was among the couples married in 1855, or even in 1847; but upon applying the proportions deduced from the facts of 1847, it is found that in 1855 there must have been nearly 1,488,000 families in which the husband and wife could both write their names; 905,912 families in which one could write,

NOTE.—The above numbers are for the Counties *proper*, and not for the "Registration Counties."

BIRTHS.

Births (exclusive of still-born).—The births of 635,043 children were registered in 1855, and the births were 3·380 to 100 of the population, or 1 birth to every 30 of the population. The births fluctuate little; but the ratio of the births registered to the population (100) has risen from 3·029 in 1838 to 3·380 in 1855. This increase is partly due to improved registration.

TABLE VII.—ENGLAND. BIRTHS, 1855.—NUMBER and PROPORTION of Male and Female Children born in and out of Wedlock.

REGISTRATION COUNTIES.		Male Children born.	Female Children born.	Born in Wedlock.		Born out of Wedlock.		MALES born to every 100 FEMALES born.	MALES born in Wedlock to every 100 FEMALES so born.	MALES born out of Wedlock to every 100 FEMALES so born.	CHILDREN born out of Wedlock to every 100 Births.

The ratio of births to the population (100) is greatest in Durham (4·437) and Staffordshire (4·305) among the collieries. It is least in Westmorland (2·712), Hereford (2·720), Devon (2·732), Rutland (2·778), Berks (2·832), Somerset (2·836), Hertford (2·839), and Oxford (2·850). The births have decreased in these counties since 1850; at the same time they have increased in Durham and Staffordshire.

TABLE VIII.—ENGLAND. BIRTHS 1855.—PROPORTIONAL Number of BIRTHS registered in each Registration County in the Year 1855, and in each Season of the Year, or the Number of Births in each Quarter to 1000 Births in the Average Quarter.

REGISTRATION COUNTIES.	BIRTHS to 100 Persons living.	Proportional Number of Births registered.*				
		In the AVERAGE QUARTER assumed to be 1000.	In the FIRST QUARTER ending March 31.	In the SECOND QUARTER ending June 30.	In the THIRD QUARTER ending Sept. 30.	In the FOURTH QUARTER ending Dec. 31.

* In calculating the proportional number of births in the four quarters a correction has been made for the difference in the number of days in each quarter.

Sex.—323,960 boys and 311,083 girls were born in the year. 104 boys were born to every 100 girls. In the county of Derby the boys were 101·5 to 100 girls, in Monmouth 101·5, in Leicester 101·9 to 100, in Cambridge 108·1, Northumberland 108·4, Rutland 108·5, Oxford 109·8 to 100 girls. Derby (101·5) and Oxford (109·8) present the extremes. In London the proportion of boys was 103·5; it is generally below the average of England and Wales.

Seasons.—The births were most numerous 166,225, in the first quarter; least numerous (148,841) in the last quarter of the year. Putting 1000 to represent the average number of quarterly births, the proportional numbers in the quarters of 1855 were 1060, 1044, 966, and 930. The influence of the seasons varies in the several counties as shown in Table VIII.

Children born out of wedlock.—40,783 children, namely, 20,871 boys and 19,912 girls were born out of wedlock; giving the proportion of 6·4 such children to every 100 children born alive, nearly 1 to 15. The proportion is thus lower than it was (6·8) in the three years 1850–1–2. The counties in which the greatest proportion of births out of wedlock occur are Norfolk (10·1), Hereford (9·9), Salop (9·8), Cumberland (10·6), and Westmorland (10·0); while Kent (5·2), Hants (5·8), Northampton

1855	- -	4,435,699	635,123	14·3

(5·8), Huntingdon (4·6), Devon (5·7), Cornwall (5·1), Gloucester (5·5), Warwick (5·4), Durham (5·6), and Monmouth (4·6) are the counties in which the proportion of births out of wedlock is lowest; if we except London (4·0), where all the illegitimate births are probably not registered, and the parts of Middlesex and Surrey out of London.

The proportion of children born out of wedlock to the number of unmarried women of the ages 15-55 in the several counties, will be found for one year in my Fourteenth annual Report (p. xii).

DEATHS.

425,703 persons died in the year; and the annual rate of mortality was 2·266 per cent. Since the year 1838 the mortality was higher in seven years than this rate; it was 2·288 in 1840, 2·306 in 1846, 2·471 in 1847, when influenza was epidemic; 2·306 in 1848, 2·512 in 1849, when cholera was epidemic; 2·288 in 1853, and 2·352 in 1854, when cholera was again epidemic. The mortality was lowest in 1845 and 1850, when the rates were 2·089 and 2·077. The range of the mortality in eighteen years was from 2·077 (*one in 48*) to 2·512 (*one in 40*); and the average rate of the eighteen years was 2·246. Thus the minimum rate fell only ·169 below the average; while the maximum rate was ·266 *above* the average rate.

The fluctuations in the rate of mortality are subject to this law, that the excess in the mortality from zymotic diseases raises the mortality much above the average, while the reduction in the mortality never falls in a healthy year to an equal extent.

Sex.—The mortality of males was at the rate of 2·348 per cent., of females 2·187 per cent. in the year; and these rates are to each other as 107 to 100. So if 100 females die out of a given number of females, out of an equal number of males 107 males die. But the number of females in England and Wales is greater than the number of males, and the deaths of males (216,587) were to the deaths of females (209,116) in the

TABLE XI.—ENGLAND. DEATHS.—ANNUAL RATE of MORTALITY of Males and of Females, 1838-55.

YEARS.	DEATHS.		Deaths of Males to 100 Deaths of Females.	Of equal Numbers living, the Number of Male Deaths to every 100 Deaths of Females.

Average of 18 years, 1838-55 - -	2·327	2·165	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·335 deaths of males; to every 100 females living there were 2·133 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males and females*; and that out of *equal numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

proportion of 104 to 100; or nearly in the same proportion as the sexes in the births (104 boys to 100 girls).

Note.—In deducing the results given in this Table a correction has been made for increase of population, based on the numbers enumerated in 1841 and 1851, on the assumption that the increase was uniform in each year (1841–1851). Since the Census of 1851, as no satisfactory data exist for ascertaining the progress of the population, which has been much interfered with by emigration and other causes, the increase has been taken to be approximatively represented by the excess of births over deaths registered in each respective year ending June 30th.

Localities.—The Tables XII., XIII. show the rates of mortality in the several counties, year by year from 1845 to 1855; together with the averages of two periods of ten years, and the density of the population.

Ages.—The mortality varies at every year of age, and it decreases from the date of birth to the age of 10–15, at which point it begins to increase. Thus the average mortality among male children under 5 years of age was at the rate of nearly 74 in 1000; at the age of 5–10 it was 9; at 10–15, 5 in 1000; in the next period of life 15–25 out of the same average numbers living (1000) 8 die, and in the following decennial intervals of age the mortality is nearly 10, 13, 19, 32, 68, 150, 303, and 452; so that to every 1000 old people of the age of 95 and upwards, 452 die annually. The deaths at different periods of life are not always from the same diseases, and where the same disease is fatal at every age, its degree of fatality varies. The zymotic diseases fall with unusual severity upon

TABLE XIII.—DENSITY OF POPULATION 1841–51, and the ANNUAL RATE OF MORTALITY per Cent. in each County during the 10 Years 1843–1853 (excluding 1849); in the Cholera Epidemic Years, 1849 and 1854; and in 1855, arranged according to the Mortality in 1843–1853.

* The *Hectar* is the unit of land measure in the Metrical system, and it is equal to a square of 100 *Meters*, = 109·3633 yards, to the side. It is equivalent to 2·471143 (nearly 2½) Statute *Acres*, or, expressed in other terms, a Statute *Acre* represents ·404671 (rather more than 4–10ths) of a *Hectar*.

people of particular ages, as it will be seen that cholera did in 1849 and 1854, upon comparing the mortality at the twelve periods of life in Table XIV.

The mortality was in 1855 below the average of the preceding ten years at all ages under 45; after the age of 55 the mortality was above the average of those years. This higher mortality of old people was probably the result of the extreme cold in the earlier months of 1855.

In the three early periods of life (0-15) the mortality of *males* exceeds the mortality of *females*; as is also the case after the age of 35 up to extreme old age; but from the age of 15 to 35 the mortality of females is in excess. The same observation applies with very little exception to the decennial average, as well as to 1855.

The seasons.—The winter of 1855 was a remarkably cold season, and the deaths amounted to 134,542. The average number of deaths in the five previous winter quarters was 108,022; so that the cold was probably the cause of more than *twenty thousand* deaths. The deaths in

The Table may be read thus:—Of 100 Males living of the age of 35 and under 45, 1·272 died in 1846, 1·436 in 1847, and so on for other years, a correction for increase of Population having been made for each Age in each Year; and the deaths of persons whose ages were not returned have been distributed proportionally over each age. The data upon which this Table is constructed appear in this or have appeared in the previous Reports, and in the Census Report. See Census Report 1851; and the Annual Reports of the Reg. Gen., particularly the 8th and 9th.

the summer quarter were below the average. The distribution of the mortality over the four seasons, is shown in Table XVI., where it will be seen that the average quarter being set down at 1000, the relative numbers of deaths in the four seasons were 1280, 1001, 816, and 903.

I now submit to you a brief abstract of the observations in the Quarterly Returns, which are prepared from the Registrars' statements, and published within the month immediately after the close of each quarter.

SUMMARY OF THE QUARTERLY REPORTS 1855.

First Quarter.—January, February, March.*

The births are above and the marriages below the average numbers of the season ; and as the consequence of the excessively cold weather the mortality of the quarter is the highest on record since the commencement of the civil registration.

* The numbers published in the Quarterly Reports were derived from returns furnished for that purpose by the Registrars; in the present re-publication the figures have been corrected from the annual abstracts.

Births.—166,225 children who were born alive had their names inscribed on the registers in the three months of January, February, and March. This number exceeds by twenty thousand the numbers that appear in the return for the preceding quarter, and by five thousand the numbers in the return for the corresponding first quarter of 1854. The rate of births was 3·603 per cent. The increase of births is chiefly in London, in the West Midland Counties, in the Northern Counties, and in Wales.

Increase of Population.—As the number of births was 166,225, and of the deaths 134,542, the excess indicates that the natural increase of the population was 31,683 in the first three months of the present year. In the same period 36,677, or, exclusive of 2217 foreigners, 34,460 emigrants left the ports of the United Kingdom at which the Government has Emigration officers. About 15,806 of the emigrants were of English origin; so that the natural increase by births would be diminished to this extent, if there were no compensating immigration of the Irish and Scottish population into England.

The emigration from the United Kingdom to the United States has fallen from 51,929 in the winter of 1851 to 36,067 in the winter quarter of 1854, and 18,427 in the corresponding quarter of the present year. The emigrants to the Australian colonies were, in the quarters that ended on March 31st, 1003 in 1847, 2942 in 1851, and 17,444 in 1855. The remarkable diminution in the number of emigrants from Ireland to the United States deserves attention.*

The Prices of Provisions, and the Weather.—The price of wheat has been more than 50 per cent. higher than it was in the quarter of 1853 that ended on March 31st, but 9s. 7d. per quarter lower than it was in the beginning of 1854. Beef is 25 per cent. dearer than it was in 1853, and 7 per cent. dearer than it was in 1854. Mutton has been cheaper than it was in 1853, and so have been potatoes. The meteorology, and all the peculiar characteristics of the severe weather, are described by Mr. Glaisher.

State of the Public Health.—The health of the population generally has been bad; and the mortality has greatly exceeded the average. 134,542 deaths have been registered, which is 20,000 in excess of the corrected average of the winter quarters. This addition to the ordinary mortality of winter, which is in England the most fatal season, is referable to the low temperature, with the consequent hard times, against which it is difficult for the wages classes to make an adequate provision; and in other countries, where there is no such system of relief as is administered under the English poor law, the suffering and the mortality are much greater in severe seasons than they are in England.

Persons of advanced ages among all classes have been cut off in great numbers, and have thus fallen before they had passed through the evening of life. Young children have also died in considerable numbers. Bronchitis and the congestive diseases of the lungs have been the immediate causes of death. The frost, which braces the nerves of the hardy and strong, chills the veins of the aged and weakly. The temperature of the night falls, as Mr. Glaisher shows, 11° on an average below the temperature of the day; and it is in the night undoubtedly that the respiratory organs are most frequently injured, when the water freezes in the bed-rooms of houses that are not warmed by fires, or by warm air diffused by Dr. Arnott's and other admirable inventions.

The mortality in the country districts was at the annual rate of 26 deaths in 1000 living; in the town districts at the rate of 32 in 1000

* From a Return with which the Registrar General has been favoured by the Emigration Commissioners.

living : out of equal populations, there were *six* funerals in the towns to every *five* funerals in the country districts; and the town population is increasing by immigration much faster than the country population; so that, unless measures for the improvement of the health of the artisans, the tradesmen, and the professional and wealthy classes in towns, are immediately adopted, the lives of many, and the vigour and energies of large masses of the English population, will be lost, or for ever impaired.

The 134,542 deaths do not include deaths that have occurred at sea during the quarter, and have been entered upon the marine register, neither do they include the deaths among our soldiers abroad, as no provision has yet been made for placing the names of the men who die in the service of their country abroad, on the national registers.

The excess of mortality in the quarter is diffused over the whole kingdom; nor is it evident that the northern have suffered more than the southern counties. The deaths in London exceeded by 3247, or 1-fifth part, the deaths in the winter quarter of 1854; the deaths in the rest of England were 19,452, or nearly in the same degree in excess of that season. In the South-eastern Counties the deaths were 11,256 in the place of 8400. The Epsom district suffered from scarlatina; Guildford from small-pox and measles; Farnham from fever, measles, whooping-cough, and diarrhoea. The deaths for the first time exceed the births in Farnham. In the Bexley sub-district in Kent there were as many as forty cases of small-pox at one time: only those unvaccinated died. Scarlatina prevailed in Folkstone, Elham, Portsmouth, the Isle of Wight, Kintbury, Faringdon, and Fyfield. In the barracks at Winchester, occupied by about 2000 men, chiefly recruits and invalid depôts, 40 men have died, chiefly of acute pulmonary complaints. 46 deaths occurred in the new military hospital, Portsea. Small-pox, imported, it is believed, by the Essex rifles, was the cause of 6 deaths in Windsor, where also 2 children died in February of choleraic diarrhoea in a cleanly country cottage.

The South Midland Counties suffered from scarlatina and fever in several districts. In Oxford 25 deaths occurred from small-pox, and the deaths exceeded the births in number. In Cambridge the mortality was high. In Leighton Buzzard the deaths were nearly double the average.

In some districts of the Eastern Counties measles, small-pox, and whooping-cough prevailed. The mortality was high in Norwich and several other places. The mortality in the South-western Division, where the climate is milder, rose to the same extent. In Salisbury the deaths in the winter quarters of 1853 and 1855 were 77 and 79; and the same result is noticeable in districts all over the country, which must have been exposed to nearly the same degree of cold as the districts in which the cold winter proved most fatal. Cold under the shelter of houses in civilized states only destroys people indirectly, by inducing diseases; is chiefly fatal to the aged or feeble; and it arrests some classes of diseases; so that under certain circumstances the mortality of a district may be lower in a cold than it is in a mild winter.

Influenza was epidemic in Saint Agnes, Truro; typhus in Lerrin, Liskeard; Plymouth and the surrounding districts are still in an unsatisfactory sanitary state. In Bath, Clifton, and Cheltenham the mortality was above the average.

The West Midland Counties suffered somewhat less than the counties of the previous Division. The mortality was high in Hereford, where measles was epidemic; and somewhat above the average in Gloucester, Shrewsbury, Stafford, Worcester, and Warwick. 2094 deaths were registered in Birmingham and Aston; 112 less than the deaths in the winter quarter of 1854, but 352 more than the deaths in the winter quarter of 1853.

In the North Midland Counties the mortality was raised to nearly the same extent (1-seventh) as in the other Midland Counties; the districts of Leicester, Lincoln, Nottingham, and Derby exhibited little or no increase. Scarlatina, measles, and hooping-cough prevailed extensively in Lincolnshire.

Cheshire and Lancashire exhibited but a slight increase in the mortality. 3674 deaths were registered in Liverpool and West Derby; 3261 in Manchester and Salford; the latter number being considerably above the average.

Yorkshire suffered less than other divisions. In Leeds and Hunslet, where 1321 deaths were registered, the mortality was below the average, and in Sheffield and York the mortality was about the average.

Measles and scarlatina prevailed to some extent in the Northern Counties; the mortality was raised one-eighth part above the average. In Monmouthshire and Wales the same diseases were epidemic, and the mortality was raised about one-sixth above the mortality of the winter of 1853. The Registrar of Wrexham says:—"The severity of the winter, and the high price of provisions of all kinds, have had a considerable effect on the health of young and old people."

Second Quarter.—April, May, June.

The returns present these general results: the marriages in the quarter were below the average numbers; the births and the deaths slightly exceeded the average proportions. The severe weather, the high price of provisions, the diminution of employment in some districts, and the withdrawal of an increased number of men from the country by the army and navy abroad, account for the decrease in the marriages. The stagnation in the winter was, however, probably only temporary; for war, instead of depressing, appears to increase the industry, the invention, and the energy of Englishmen. The rapid rate of growth of the British population commenced and attained its culminating point in the last war.

Marriages.—38,549 marriages were celebrated in the quarter; or less in number by 1969 than the marriages in the corresponding quarter of the year 1854.

Births.—The births of 165,277 children were registered in the quarter that ended on June 30th, 1855; or less by 7180 than were registered in the corresponding quarter of the previous year, and more, to nearly the same extent, than were registered in the spring quarters of 1851–53. In the West Midland Counties, particularly in Staffordshire, and also in Cheshire, in Lancashire, in the West Riding of Yorkshire, and in the Northern Counties, the births of the quarter exceeded to some extent the births in the spring quarter of 1853.

Increase of Population.—As the number of births was 165,277 and of deaths 106,493, the natural increase of the English population in three months may be set down as 58,784, exclusive of the increase of immigrants from Scotland, Ireland, the Colonies, or foreign parts. In the same period 65,210 emigrants, including a certain number of foreigners, left the ports of the United Kingdom at which there are Government Emigration officers. How many of the emigrants were born in England has not yet been learnt; but 39,509 proceeded to the United States, 10,397 to British North America, 14,639 to the Australian Colonies, and 665 to other places.

The Prices of Provisions, and the Weather.—The average price of wheat, which in the three months April, May, June 1853, was at 44s. 6d. a quarter, was in 1854 at 78s. 4d., and in the corresponding months of the present year at 73s. 4d. Bread has been dear for two years, or since the harvest of 1853. Beef is somewhat cheaper, and so are potatoes; while mutton is at the same price as in the spring quarter of 1854.

The weather during the quarter was remarkable for the continuance of the cold, which in the previous quarter had been unusually severe. Except on a few days only, the temperature was below the average. There was a deficiency of rain.

State of the Public Health.—The public health has partly recovered from the effects of the late epidemic cholera, and from the severe weather of last winter, and the mortality, which is on the average at the annual rate of 2·243 in 100 on the population, was 2·277 in 100 in the last quarter. The average rate of mortality in the spring quarter in 117 districts, comprising the chief towns, is 2·455 in 100 persons living, in the small towns and country parishes 2·056 in 100. The mortality in the last quarter was at the rate of 2·503 in 100 in the town districts, 2·097 in 100 in the country districts.

There were 106,493 deaths in the quarter; or 3907 more deaths than were recorded in the corresponding quarter of 1854; for the cholera, which was epidemic in that year, only became fatal in the subsequent quarter. In the Eleven Divisions the deaths varied little during the spring quarters of 1853, 1854, 1855.

In London some improvements are referred by the Registrar of St. Giles to the working of the Lodging House Act; and the health of Bermondsey has been better since the tidal ditches have been filled up, and the parish has been paved and drained.

In the South-eastern Counties, Farnham has for the last seven months been suffering from low fever, hooping-cough, and measles; Canterbury from small-pox, scarlatina, and bronchitis. Alverstoke has suffered severely from scarlatina, and the deaths (211) exceed the births (121): the same excess of deaths is observed at Winchester, where 23 men died in the barracks. The death of a female aged 105, at Windsor, is mentioned; and it is stated that her two sons are above 80 years of age.

In the South Midland Counties, Northampton and Bedford experienced a rate of mortality that much exceeds the average. Scarlatina has raged. In Royston the parish of Kelshall has suffered from typhus; the drainage and water are "very bad."

In the Eastern Division several districts have been healthier than usual; Norwich, Depwade, Mitford, Downham, and Thetford have, however, suffered from a higher than their average death-rate. Small-pox, measles, and scarlatina have prevailed in several districts of Essex and Norfolk.

In the South-western Division the mortality is about the average, but it was higher than it was in the preceding year in Wilts, Devon, Cornwall, and Somerset. The excess was considerable in Chippenham, Stoke Damerel, and Liskeard. The mining population in Cornwall is not in a satisfactory sanatory condition. One of the Registrars of Liskeard says:—

"In Calstock, one of the parishes of my district, there is an epidemic of scarlatina. Some houses of miners and others are overcrowded, and due regard is not paid to ventilation. There are no waterclosets, privies, or other conveniences belonging to the premises, and the places for the deposit of soil, &c. are in many places immediately adjoining the houses, in some almost touching the door of the dwellings. In another parish (Callington) there are several unregistered lodging houses, and the whole of them are in a filthy and unwholesome condition; every night there is a great influx of vagrants of the lowest order, and on my visiting them one night after 10 o'clock I found 5 persons in a bed, and as many as 18 in one room. It is a great pity the magistrates do not look into the matter and abate the nuisances."

In the West Midland Division, the mortality was lower in the spring quarter both in Staffordshire and Warwickshire than it was in the spring of 1854; measles, small-pox, and scarlatina are mentioned as prevailing in some districts of Shropshire.

The mortality in Lincolnshire, of the North Midland Division, was above, in Leicestershire, Nottinghamshire, and Derbyshire below, the death-rate of the previous spring quarter (1854). Scarlatina occurred in Lincoln,

Horncastle, Caistor, and Gainsborough. The frame-work knitting trade has been bad for some time in Basford, near Nottingham.

In the North-western Division, 2490 deaths were registered in Cheshire, 14,478 in Lancashire. A death from Asiatic cholera was returned at Runcorn on the 1st of June. Some sanatory improvements are noticed in the Lancashire towns. Liverpool is healthy at present. In West Derby it is said :—

“The district has been, during all the quarter, in a very healthy state, which may in a great degree be owing to the extent of street and house draining, street cleansing, and other excellent sanatory improvements that have been adopted by the corporation of Liverpool in the municipal part of the district.”

At Wigan sanatory improvements are progressing, such as street sewerage, drainage of private property, and the removal of nuisances. The Registrar of North Bury writes :—

“The deaths in this quarter are considerably under the average, and amount to just a half the number of births. No small-pox, measles, scarlatina, hooping-cough, or cholera. The sewerage, water supply, paving, scavenging, &c. of the town are in a very satisfactory state. Large sums have been judiciously expended by the town commissioners during the last seven years, to the comfort and advantage of the inhabitants, and the appearance of the town now offers an agreeable contrast to other manufacturing towns in this district.”

These facts are encouraging, as they show that the high mortality in the Lancashire districts may be greatly diminished, and that substantial improvements are followed by immediate results. Measles, scarlatina, and typhus prevailed in some districts of Lancashire ; and the mortality was higher in Manchester than it was in the two previous springs.

In Yorkshire the deaths (10,423) were below the average numbers ; and the decrease was chiefly in the West Riding. Leeds and Sheffield were healthier than in the previous two springs. The Registrar of Bradford East refers the low mortality to sanatory improvements ; vaccination is, however, neglected. He singularly enough observes :—“There is an increase in the births this quarter, caused by a slight improvement in trade, and the settling at home of a great number of the wives of the militia.” The linen trade in Barnsley is depressed ; the colliery and iron works are carried on with vigour, and have drawn many families to the works ; the births and the deaths exceed the average numbers.

The Northern Counties experienced their average rate of mortality ; 5593 of the inhabitants died. Small-pox and scarlatina have been fatal in some districts of Durham ; vaccination is neglected.

In Monmouthshire and Wales the deaths were 7366, which is near the average number. Measles prevailed in Abergavenny and Crickhowell.

Third Quarter.—July, August, September.

The returns of deaths exhibit as their general result a favourable state of the health of the country in summer, and a striking improvement on the returns of the summer quarter of the previous year. The diminution of the number of marriages indicates some pressure on the resources of the people from the high price of bread ; but the low rate of mortality implies that under the English system of Poor Laws, imperfect as it is, the labouring classes suffer less distress than the workmen of the Continent, who have no legal right under any circumstances to relief. Liberality in the administration of the Poor Law is the natural remedy of many of the evils of high prices in England.

Marriages.—37,308 marriages were registered in the quarter, or less by 874 than the number in the corresponding quarter of the previous year, when the number of marriages was considerably above the average. The number of persons married was 74,616. The annual average rate of the summer quarter is 776 marriages to 100,000 of the population ; in the summer of 1854 it was 813, in the last summer 787. In Hampshire, chiefly in Portsea Island, the Isle of Wight, and Southampton, and in

some districts of Buckinghamshire, Bedfordshire, Northumberland, and Wales the marriages increased; in the mining and manufacturing districts the greatest decrease is observed, and notably in the mining districts of Cornwall, in Staffordshire (Wolverhampton and Dudley), in Cheshire, in Lancashire (Manchester, Bolton, and Liverpool), and in the West Riding of Yorkshire (Halifax and Leeds).

Births.—154,700 births were registered in the quarter that ended on September 30th. This number only exceeds by 24 the number of births in the summer quarter of the year 1854, and indicates a rate of birth ($3\cdot261$) above the average of the season ($3\cdot146$ annually). The births increased to some extent in the counties of Hertford, Northampton, Essex, Stafford, Worcester, Warwick, Leicester, Derby, Durham, and Northumberland.

Increase of Population.—154,700 births and 87,646 deaths were registered. The natural increase of the population of England and Wales in the three months is therefore 67,054, which makes the gain of people in nine months in this part of the empire 157,521. Of the number of immigrants from Scotland, Ireland, and foreign countries no record is kept. The emigrants from the ports of the United Kingdom at which there are Government Emigration Officers amounted to 44,698; of whom 13,486 were ascertained to be of English, 3534 of Scotch, 18,701 of Irish, 3093 of foreign origin; the origin of 5884 emigrants was not distinguished. After taking a due proportion of the latter class the English emigrants will amount to 15,530; nearly half of whom sailed to Australia, and the rest to our North American Colonies and the United States.

The number of emigrants from the United Kingdom, which was 109,236 in the summer quarter of 1852, has fallen to 44,698, which is nearly the same number as emigrated in the summer quarter of 1847.

The Prices of Provisions, and the Weather.—Among the most important circumstances that affect the numbers of births, deaths, and marriages, must be placed the state of trade, the prices of food, and the weather. The prices of consols in the three quarters that ended in September 1853, 1854, and 1855 were 97 , $93\frac{7}{8}$, and $90\frac{6}{8}$; so the interest of money rose in the proportion of the reciprocals of these numbers. The prices of *wheat* in the same seasons were 51s. 10d., 63s. 10d., and 76s. 1d. a quarter; of *beef*, by the carcase, in the London markets, $5\frac{1}{8}d.$, $5\frac{6}{8}d.$, and $5\frac{7}{8}d.$ a pound. The prices of these articles of food therefore rose in the interval of two years, wheat 48 per cent., beef 15 per cent. Mutton, in the three summer quarters, was sold at $6\frac{1}{8}d.$, $6d.$, and $6d.$ a pound. Potatoes by the Water-side Market, Southwark, were sold at 117s. 6d., 80s., and 74s. a ton. The fall of 37 per cent. in the price of an article of food which is consumed at the tables of all classes, and by persons of all ages and both sexes, is an important set-off against the rise in the price of wheat, and may partly account for the fact that the public health is better,—the rate of mortality lower,—than it was in the summer of 1853.

The weather of the three months is described by Mr. Glaisher. The mean temperature was $60\cdot4^{\circ}$, and was in every month slightly above the average at Greenwich. Rain which was in excess in July was below the average in August and in September. Since November 1853, $32\frac{3}{4}$ inches of rain have been collected about London, which is $14\frac{1}{4}$ inches or 30 per cent. less than the average. Wheat was cut at Ryde on July 14th, at Aberdeen on September 10th; so that the wheat harvest in the island extended over nearly two months.

State of the Public Health.—87,646 deaths were registered in the quarter that ended on the last day of September, and the annual rate of mortality in the quarter was 18·48 deaths to 1000 living, while the average rate of the summer quarter is 20·73. The annual rate of the summer quarter of the year 1854 was 24·23, and the number of deaths

were 113,843; the excess being due in a considerable measure to the epidemic of cholera and diarrhœa which broke out at Newcastle and other places in 1853, and was exceedingly fatal in London and several districts in the summer quarter of 1854.

In 117 districts comprising the chief towns 44,169 deaths were registered; while in the 511 districts comprising the small towns and the country parishes the deaths were 43,765; the annual rate of mortality was 1·643 in the latter districts, and 2·165 in the town districts, to every 100 of the population; or ·522 more in the towns than in the open country.

The health of the towns exhibits some improvement, for the mortality to 100 living has fallen from 2·633 in the ten summer quarters (1845–54), to 2·165 in the summer quarter of 1855; but the great incentive to exertion remains, that the mortality is certainly not inevitably at a higher rate than 1·643 in the summer quarter, as that rate only was actually experienced on the area of 511 districts.

The great work of the day is to improve the health of the people; and the first steps towards its accomplishment are the throwing open building grounds on favourable sites, facilitating the distribution of the population over town and country by railways, supplying the towns with pure water, draining and opening streets, and removing constantly for immediate deposit in the soil the town guano, which would no doubt prove an excellent substitute for the guano that is now fetched from the islands of a foreign state in the Pacific Ocean by British ships, which could in former ages only be allured round Cape Horn by silver and gold.

The health of London is described in the weekly tables. The deaths were 13,069 in the quarter, or less by nearly *twelve thousand* than the deaths in the corresponding quarter of last year, when cholera was epidemic, and less by 110 than the deaths in the corresponding quarter of 1853. The Belgrave sub-district, which lies low and is still supplied with the impure water of the Thames, suffered, the Registrar states, from low continued or gastric fever.

The mortality has before in England as in other countries been low after an epidemic, and it has been hence inferred that epidemics only carry off prematurely people who would otherwise die in the course of a few years. But it will be observed that in every Division, although cholera was not generally epidemic, the mortality is lower than it was in 1854.

The deaths in the South Eastern Division were 7482, or less by 2060 than in the corresponding quarter of 1854. At Gillingham dysentery and diarrhœa prevailed, the deaths of some invalids from the Crimea and the Baltic were registered. The cholera seeds still remain about Sandgate, where 5 persons died from the disease, besides 2 in the town of Folkstone, and 34 men of the foreign legion, who were stationed in the Folkstone district.

In the South Midland Counties 5758 persons died; or less by 1116 than died in the summer quarter of the previous year. Scarlatina has prevailed in Bedford, and the Registrar remarks that “the great majority of deaths from this and other zymotic diseases have occurred in the worst drained and most densely populated localities.”

In the Eastern Counties,—Essex, Suffolk, and Norfolk,—the mortality fell to nearly the same extent, and was at a lower rate than it was in 1853. A river bargeman died of cholera in West Ham; he was brought from Poplar in London. Two men were brought ashore, and died of “malignant cholera” at Lowestoft.

In the South Western Counties, where the mortality was not raised above the average of the season by cholera in 1854, the mortality was below the average in 1855; thus implying a favourable sanitary constitution of the season quite independently of any previous removal of weakly people by epidemic cholera. The Registrar of Redruth says:—“People are now beginning to think that cleanliness and the removal of

nuisances from near their houses are conducive to health ;” and he notices that the “deaths are much below the average.” The removal of the “muck” to some distance from the farm-houses and cottages would not only be conducive to the health of the farmers and labourers’ families, but lessen the mortality of every kind of stock.

The West Midland Counties exhibit a low rate of mortality (9692 deaths); Birmingham has lost some lives from diarrhœa, but has been on the whole unusually healthy.

In the North Midland Counties the deaths are low in numbers (5286) when compared with the deaths of previous years.

14,905 deaths were registered in Cheshire and Lancashire, against 17,225 deaths which occurred in the summer quarter of last year. Diarrhœa was becoming prevalent in Chester; and one death from cholera was registered. Liverpool and Manchester exhibit signs of increased salubrity.

In Yorkshire the deaths were 9177, against 10,829 in the corresponding quarter of 1854; Leeds and Hull were healthier than usual.

The Northern Counties lost 4998 lives, against 7058 in 1853 and 5907 in 1854. The great outbreak of cholera in Newcastle-upon-Tyne raised the mortality in that town to 2085 in the summer quarter of 1853, against 531 in the summer quarter of the present year.

The deaths in Monmouthshire and Wales were 5242, and the mortality was less than in either of the summer quarters of the two previous years.

The decrease of the mortality in some districts is striking, and the registrars in their notes endeavour to account for this evident fact. Some refer the improved health of the people to the fine weather; others to active employment in the harvest; others to the removal of the population, either in search of employment, or by drafting into the militia, and into the ranks of the army. In the mining district of Redruth the Registrar conceives that “the frugality and temperance” promoted by the high price of provisions has been salutary; in other districts the benefits of improved health are connected with “good wages and plentiful work;” in many places the utility of sanatory measures is admitted. The Registrar of Pontespury, who has registered no death for two months, “can assign no cause.” One registrar makes the following statement:—

“The deaths are below the average. In the township of Workington, containing a population of 6122, the deaths during the last 9 years have averaged 42 quarterly; this quarter they are 21. In the other 9 townships, containing a population of 3412, there have been only 4 deaths. Some ascribe the decreased mortality to Providence; others to improved sanatory arrangements.”

Various causes in operation undoubtedly contributed to this happy result:—that if all the deaths of British soldiers in the Crimea during the last three months were added to the deaths in England the sum would be less by some twenty thousand than the deaths registered in England during the three summer months of 1854. More lives may be saved by sanatory arrangements at home every year than have ever perished abroad in the years of our greatest losses in war; and the enlightened people of this kingdom will suffer no such embarrassment as the Registrar of Workington has recorded if this result be realized, as they know that all effectual measures for the improvement of the human race receive the blessing, because they are the inspirations, of Divine Providence.

Fourth Quarter.—October, November, December.

The return is on the whole satisfactory. But the marriages were slightly below the average of recent years, from various causes. The births were near the usual number; and the mortality was much below the average, both in the towns and in the country.

Marriages.—47,070 marriages were celebrated, and consequently 94,140 persons were married in the three months that ended on 31st December 1855. The number of marriages in the first quarter of the year was 29,186, in the last quarter 47,070; but it has always hitherto happened

in England that the marriages are most numerous in the Christmas quarter after harvest, and least numerous in the Lent quarter, so that this difference is in accordance with the ordinary state of things. The rate of marriage in the last quarter of the year was much below the rates of marriage in the corresponding quarters of the years immediately preceding. The rate of marriage decreased in London and in the manufacturing districts, and the decrease is probably referable partly to the high price of provisions, and partly to the increase of the army and navy, where men do not marry to the same extent as in the civil population.

Births.—148,841 births were registered in the last quarter of the year 1855; or more in number by 2402 than the births in the corresponding quarter of 1854. The annual rate of births in the quarter was 3·128 per cent. on the population; which is near the average (3·112). There was an increase of births in every division, except in the two divisions south of the Thames and in the Eastern Counties. The Registrars account in various ways for the decrease of births. At Royston the Registrar says:—"Many young married men are gone into the militia." The militia is referred to also by the Registrar of Hatfield; and at St. Albans "the removal of many young women with the numerous recruits," accounts for the decrease of births. Upon the other hand, "the formation of the camp at Aldershot" it is said "accounts for the increase of births and deaths" in the district of Farnham. The registrar of Southampton notices that only 84 births took place in May, while the numbers in that month in previous years had varied from 95 to 142; and on the whole he has a decrease in the year of 138 births; which he attributes "to the fact that so many ships belonging to this port have been detained in the Black Sea, rather than to a diminution of the population." The decrease of births in Camborne, Redruth, is explained by "the fact that a very large proportion of the male population has been for some time past employed in America at the copper mines of the Lake District, and the gold diggings of California and Australia, where a great number of Cornish miners have emigrated, leaving their wives and families at home, who are maintained by remittances from the husbands."

Increase of Population.—In the Northern and Midland Counties the effects of temporary or local causes of the decrease of births in the South have been neutralized; and generally in England there is little ground of complaint or of any apprehension of a paucity of births, as 635,043 children were born in the year of war 1855; or 209,340 in excess of the number of deaths (425,703). In the last quarter of the year the excess of births over deaths, or the natural increase, was 51,819. Of the immigration into England and Wales from Ireland and Scotland during the period no records exist.

24,207 emigrants sailed from the ports of the United Kingdom at which there are Government Emigration officers; 16,111 to the United States, and 7329 to the Australian colonies. 7615 were ascertained to be of English origin, 840 Scotch, 10,689 Irish, and 1426 foreigners; the origin of 3637 was undistinguished.

The Prices of Provisions, and the Weather.—Upon comparing in the table the prices of the principal articles of food in the last quarters of the years 1853, 1854, 1855, it is seen that wheat was 69s. 10d., 68s., and 79s. 4d. a quarter; beef was 5d., 5½d., and 5⅞d. a pound. Mutton 5⅜d., 6d., and 5⅞d. a pound. Bread was dear during the last quarter. The average prices of beef and mutton by the carcase were equal, differing little from the prices of 1854, but higher than the prices of 1853. Potatoes have fallen from 150s. a ton in 1853, to 95s., and this materially alleviates the pressure from the high prices of other articles. The mean temperature of October was above, of November and December below, the averages of those months. The air was humid in October and No-

vember, dry in December. The average quantity of rain fell at Greenwich. The mean temperature varied from $46^{\circ} \cdot 5$ in Cornwall and Devon to $41^{\circ} \cdot 7$ in North Shields; the fall of rain, from 10·5 in. in Newport and Ryde to 5·5 in. in Liverpool.

The deaths of 97,022 persons were registered in the last quarter of the year; and the annual rate of mortality was 2·039 per cent. on the population, or 0·130 less than the average rate of the season (2·169).

The mortality of 117 districts, comprising the chief towns of England and Wales, was in the quarter at the rate of nearly 24 in 1000; the mortality in the other 511 districts containing the small towns and the country parishes was at the rate of 18 in 1000; the average rates of the ten autumn quarters preceding, were nearly 26 in 1000 in the large town districts, and 20 in the small town and the country districts.

The mortality was slightly below the average in each of the South-eastern Counties; Croydon and Dartford, which formerly suffered from epidemics, were healthy. Canterbury, Gravesend, and Farnham have suffered to some extent from epidemics. Small-pox prevailed among the soldiers at Canterbury, who it appears had not been vaccinated. Scarlatina prevailed in Alverstoke, Newport (Isle of Wight), Winchester and Windsor. At Winchester there have been *seven* deaths “from fever;” and, adds the Registrar, “about the same number of deaths from syphilitic gangrene or *ulcus grave*, which prevailed in the military hospital, and also in the county hospital and union workhouse, especially among women.”

The mortality is much lower than it was last year in the South Midland Counties. In a few districts epidemics prevailed. Small-pox has been fatal in Ware, in the “densely populated courts and alleys,” where vaccination was neglected. The Registrar of Royston notes:—“Sanatory arrangements much neglected, typhus very prevalent.” Scarlatina was fatal in Welwyn, Harpenden (Hertford), Chesham (Bucks), Turvey, Bedford and Cardington, Ivinghoe (Beds), in Cambridge, Ely, and Wisbeach. Small-pox occasioned some deaths in these counties. Many complaints are made of the working of the Vaccination Act. Scarlatina and fever prevailed in Cambridge both during summer and autumn.

The mortality was low in the districts of the Eastern Counties, with the exception of Risbridge, King’s Lynn, Saffron Waldon, and a few more. Scarlatina in a malignant form was prevalent in the parish of Downham and in the Ingatestone sub-district. Erysipelas, chiefly of the face, was very prevalent in Coggeshall. The Registrar of Manningtree

TABLE XVII.—ENGLAND. MARRIAGES, BIRTHS, and DEATHS in each Quarter of the Years 1838–1855.

says:—"Several fatal cases of typhus and scarlatina have occurred in the parish of Ramsey, which is situate a few miles from Harwich. I consider Ramsey to be the most unhealthy parish in this district. There is a large tract of marsh land surrounding the village, and, as far as I can learn, a great want of drainage exists. Some sanitary measures ought to be at once put in motion, otherwise the inhabitants must continue to suffer from a disease, which is so prevalent in almost every cottager's residence in the parish." At Sudbury only 54 deaths occurred in six months out of about 8000 people. The population are fully employed. The improvement in the health of Rattlesden (Stow district) is ascribed to "sanitary regulations."

In the South Western Counties the deaths (8342) were below the average. Scarlatina was, however, fatal in several districts; so was fever. In St. Keverne, in Cornwall, the excess of deaths (121 to 29 births) was the consequence of the wreck of the barque "John" on the Manacles; when the bodies of 93 emigrants were cast on shore. The diminished mortality of Edington (Westbury) is referred to the works of the sanitary inspector. The poor of Heavitree, near Exeter, suffer much from the high price of food; but soup kitchens afford some relief.

The West Midland Counties (Gloucester, Hereford, Salop, Stafford, Worcester, and Warwick) experienced a rate of mortality much below their average. The deaths were 12,594 in 1853, 13,587 in 1854, and 11,169 in 1855. The decrease is most striking in the great towns; thus, in the last quarters of 1853 and 1855 the deaths in Bristol and Clifton were 904 and 726, in Wolverhampton 858 and 694, in Dudley 1032 and 747, in Birmingham and Aston 1888 and 1440. In Coventry the deaths showed little decrease. Of the 93 deaths in the Holy Trinity sub-district "54 are those of children under 3 years old, the causes of death being generally either 'natural weakness,' 'diarrhoea,' or 'convulsions.'"

The deaths (5678), except in Rutland, were below the average in the North Midland Counties; namely, in Leicester, Lincoln, Nottingham, and Derby.

In Cheshire and Lancashire the improvement is less extensive than it is in other counties. The deaths were 16,926. The deaths in Liverpool

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 618 marriages, 3,032 births, and 2,615 deaths registered. The three months January, February, March contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

and West Derby, where scarlatina was epidemic, were 3487, or 273 more than in the last quarter of 1853. The deaths in Manchester and Salford, on the other hand, were 2396, or 371 less than in 1853. Many deaths from scarlatina occurred in Runcorn. In Knott Lane, Ashton, several deaths occurred among persons who were attended by an unqualified practitioner.

The decrease in the mortality of Yorkshire is considerable; the deaths in the last three months of 1853 were 10,670, in the last three months of the year 1855 they were 9361. Bradford, Leeds, Sheffield, York, and Hull exhibit a great diminution in the number of deaths.

The deaths in the Northern Counties, Durham, Northumberland, Cumberland, and Westmorland, were 5499, and below the average. Scarlatina has been very fatal. It prevailed with much severity in the colliery districts of Durham. The two villages in Easington, in which it was most fatal, are situated very low, on a marshy, damp, badly-drained soil. In South Shields district, where many men are employed on the construction of an extensive dock, scarlatina and typhus have prevailed. At Bedlington, Morpeth, small-pox has been raging among all classes, affecting both young and old. Those who had not been vaccinated were great sufferers. 14 persons died of Asiatic cholera, 7 of diarrhoea, in Sunderland East—the seat of the first outbreak in 1831.

In Monmouthshire and Wales 5833 persons died. Scarlatina and typhus attacked some districts; but the mortality was less than in the two previous years.

Upon the whole, the health of England and Wales exhibits evidences of improvement.

GREAT BRITAIN.

The annual report of the Registrar-General for Scotland now supplies us with the births, deaths, and marriages of that portion of the United Kingdom ; and in Table XXII. the rates of marriage, birth, and death in Great Britain are given for the first time. It will be seen that they are all lower than the corresponding rates in England ; but as Scotland contains about *one-seventh* part of the population of Great Britain, its numbers only go to that extent into the general results.

The returns of Ireland are still required, to enable us to compare the marriages, births, and deaths of the United Kingdom, with the returns of France and of the other great states of Europe ; which, although they are not called *United Kingdoms*, embody the statistics of all their old provinces in their annual reports.*

Ireland is not the least important, nor the least interesting part of the United Kingdom in the present day ; and it is much to be desired that the Registrar-General of Ireland should be enabled, by an extension of the Irish Registration Act to secure the registration of all the births, deaths, and marriages, and thus complete the annual population statistics of the United Kingdom. Ireland in this respect is alone in Europe ; it is the only

* According to an estimate, necessarily loose, by the Irish Census Commissioners, the rate of birth was 3·226, of death 2·222 per cent. in Ireland. The rates for the United Kingdom were, therefore, births 3·317, deaths 2·224 per cent. in the year 1855.

civilized country which is without a system of registration of births, deaths, and marriages.

ENGLAND AND FRANCE.

I have thought it might be interesting at the present time to compare the returns of France and the returns of England with the view of exhibiting the relative condition of the populations of the two countries.

The lucid annual report of M. Legoyt for the year 1853 has just appeared; and I have selected, for the purposes of comparison with England, the corresponding figures for that year, relating to education, marriage, birth, and mortality in France.

There can be no doubt that the analysis of the relative numbers that sign the marriage registers with marks and that write their names in the national returns, throws more light on the permanent results of elementary education than any other test that has yet been devised. That view of the matter is now taken by foreign statistis; and this interesting item appears for the first time in the French returns.

It is a remarkable fact that, exclusive of the metropolitan cities, in England and France nearly the same proportion, 34 in every 100 of the men who marry, do *not write* their names in *signing the marriage register*; the exact proportion of the ignorant men in France is 33·70, in England it is rather more, or 33·93 in 100. The French women are even less

FRANCE - - - - - (Exclusive of the Departments of the Seine, Manche, Creuse, and Vaucluse).	116,133	140,530	45·25	54·75

versed in writing than English women ; for of *French women* 55 in 100 *did not write* their names, of English women 48 *did not write* their names, but made their marks. Both the proportions are deplorably high, and show how much has to be done to convey the first rudiments of instruction to the great body of the people in two of the most enlightened nations of the world.

As the returns for France, through some accident, do not include the facts for Paris in the department of the Seine, I have excluded the marriages in London from the English returns, as in the capitals the numbers who can write are disproportionately great.

The ages of the French population are distinguished for the first time in the census of 1851; and from the census and the other report, Table (A.) has been compiled, showing the estimated population and the deaths at various ages in the year 1853. (See Appendix, p. 188.)

I subjoin a Table (XXIV.) in which the mortality of the population of the two countries is shown in juxta-position. It will be observed that the mortality of France is rather less than the mortality of England in this year; but that the rate of mortality bears differently on different periods of life in the two countries.

Another Table (XXV.) is inserted, which was constructed from the estimated population, and from the deaths at different ages in the ten years 1840-49 as given in the *Annuaire de l'Economie Politique*. In this Table the mortality of France is higher than the mortality of England and Wales; but at certain ages, in the middle periods of life, the mortality of the English people considerably exceeds the mortality of the French. This is due, it is believed, to the bad sanitary condition of all the English towns in the years 1840-49, and especially to the *greater proportion of town population in England*. For the same reason the mortality of England and Wales is greater than the mortality of Scotland, and also greater than the mortality of Ireland, as estimated by the Irish Census Commissioners.

In years of scarcity, however, the population of France suffers more from privation than the population of England. France has no system of insurance against death by starvation extending over the whole population, such as is now imperfectly provided in England, Scotland, and Ireland by the Poor Laws; and the failures of crops fall heavily upon the small proprietors, who can draw the means of living from no other source than their small parcels of land.

The water supply in the French towns is bad, and their cesspool system is abominable; hence they suffered severely from cholera in 1854.

The mortality of the population of France in 1854 was 2·746 per cent., while the mortality of the population of England in the same year was 2·352 per cent. The deaths in France exceeded the births by 69,318. The deaths by cholera are estimated at 150,000; the deaths by the scarcity, which began in 1852, was sensibly felt in 1853, and prevailed with much intensity in 1854, M. Legoyt sets down at 60,000.

Under the 96th article of the Code Napoleon, information of the death of every French soldier who dies out of France should be sent home by the regimental authorities, and entered on the civil registers of his last known place of residence in France. This law had been laxly executed until the last war, when upon a representation made to the War Minister at its commencement he replied : *qu'il allait prendre les dispositions nécessaires pour que tous les décès militaires fussent inscrits, autant que possible, au dernier domicile connu en France.* Under these regulations about 20,000 deaths of French soldiers and sailors were registered.

The present arrangements for the *civil registration* of the deaths of soldiers and seamen in foreign parts are unsatisfactory both in France and in England. The deaths of French soldiers abroad are improperly confounded with the deaths in France; whereas they should appear in the general register under a separate heading, and be compared with the strength of the army abroad; at the same time the aggregate deaths should be taken into account, and set off against the aggregate births.

In England the deaths of soldiers abroad are never inscribed upon the civil registers; and I have no means of ascertaining either the actual mortality or the causes of death of the whole of the English population, including the army and navy, until some permanent arrangement be made by the Legislature. I wrote to the Secretary of State for War in 1854, calling his attention to the subject. In 1855 I addressed the Secretary for War in a second letter, which is, with a few omissions, subjoined, as it shows the present unsatisfactory state of the question.*

* Copy of a Letter from the REGISTRAR GENERAL to LORD PANMURE.

My Lord,

General Register Office,
February 10th, 1855.

The 26th Section of 6 & 7 Will. 4. c. 86. provides for the registration of the deaths of British Seamen; but no provision is made for recording, in this department, the deaths which occur in the British army abroad.

I am aware that, upon inquiry at the War Office, relations may obtain information as to the last returns received respecting soldiers; but the enclosed Form shows that few facilities are given to the public in making these inquiries, and that precautions are

I cannot now state, as the French civil department does, the numbers of deaths in the army and navy. But if we compare the mortality of the female population of the two countries, France lost 2·721 per cent., England 2·273 per cent. of the female population at home in the year 1854.

Fecundity of the French population.—The temporary decrease of the population of France has naturally attracted attention, as it has occurred for the first time, M. Legoyt states, in the *last fifty-four years*. In considering its causes, the diminishing number of births, to which I have before adverted in my Reports, has attracted attention, and given rise to

TABLE XXVI.—1853-54. ENGLAND and FRANCE. ESTIMATED POPULATION, MARRIAGES, BIRTHS, and DEATHS, in each of the Years 1853-54.

	Estimated Population.		Marriages.		Births.		Deaths.	
	1853	1854	1853	1854	1853	1854	1853	1854
England and Wales -	18,403,313	18,618,760	164,520	159,727	612,391	634,405	421,097	437,905
France - - - -	36,225,000	36,155,682	280,609	270,906	936,967	923,461	795,607	992,779

The Population of England and Wales for 1853 and 1854 has been deduced by taking the excess of births over deaths since 1851, when the population was enumerated. The Population of France for 1853 is obtained from the "Statistique de la France, deuxième série. Tome III. (1^{re} partie)," and for 1854 by making a deduction for the decrease of births as compared with deaths in that year.

1853-54.—PROPORTION of MARRIAGES, BIRTHS, and DEATHS to the Population of England and France.

	To 100 Persons living.							
	Marriages.		Persons Married.		Births.		Deaths.	
	1853	1854	1853	1854	1853	1854	1853	1854
England and Wales -	*894	*858	1*788	1*716	3*328	3*407	2*288	2*352
France - - - -	*775	*749	1*550	1*498	2*587	2*554	2*196	2*746

The rate of mortality of females during the year 1853 was, in England 2·201, and in France 2·189 per cent. In 1854 the female rate of mortality in England was 2·273, and in France 2·721 per cent.

considered necessary to prevent unnecessary queries, and to limit the investigation to the nearest relatives or representatives of the party!

It appears to me very desirable that in this central office which contains the record of 20,000,000 deaths, marriages, and births, which have occurred in England and Wales since 1836, a record should also be kept of the deaths of all soldiers who die abroad.

I am aware that it is far from desirable to make any addition to the numerous periodical returns made by all officers commanding regiments, and I am also aware of the difficulties in time of war of obtaining the exact information as to the date and cause of death, when so many die on board transports and in distant hospitals; but I submit to your Lordship that these difficulties may be easily surmounted, and that it will be a great boon to the public if arrangements can be made that I be furnished, as soon as possible, with a nominal return from each regiment in Her Majesty's service of every soldier whose death has taken place in 1854; arrangements being at the same time made that similar information should be sent to me in future at such periods as may be considered best, either monthly, quarterly, or yearly.

Here the names would be indexed alphabetically, and information at once be afforded to the public.

I take the liberty of enclosing a Form which might be used, but if your Lordship is disposed to entertain the application which I thus venture to make to you, the authorities under your Lordship's direction will probably be able to prepare a better description of Form.

I have, &c.,
(Signed) GEORGE GRAHAM,
Registrar General.

After a lapse of six months, the Registrar-General was officially informed (Aug. 10th 1855) that Lord Panmure, after considering the subject, found that the proposal would impose much trouble in the Offices at home, and upon Commanding Officers abroad, and was "of opinion that for the present the consideration of the question had better be postponed."

controversy. It is, undoubtedly, a remarkable fact that, while the births in England go on rapidly increasing, the births of French children are not increasing, but are actually decreasing. 981,614 children were annually born (alive) in France on an average in the five years 1824-8, and 957,894 annually on an average in the years 1850-4.* In 1854 the births were 923,461 out of a population of 36,155,682 in France, and 634,405 out of 18,618,760 in England and Wales.

Thus in France to 1000 of the population 26 children were born; in England and Wales the same population gave birth to 34 children in the year 1854.

A great portion of this difference is not referable to unusual abstinence from marriage in France, as some speculators have supposed, but to the difference in the fecundity of the married women at puerperal ages in the two countries. This is shown in the annexed Table (XXVII.)

The causes of death in England and Wales in the year 1855 are discussed by Dr. Farr in a letter addressed to me, which will be found in the Appendix (p. 179).

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

TABLE XXVII.—ENGLAND AND FRANCE. 1849-53.—Number of WIVES; and SPINSTERS and WIDOWS enumerated in 1851; the Number of BIRTHS IN WEDLOCK and OUT OF WEDLOCK registered in the Five Years 1849-53; and the Average Annual Proportion of Births in Wedlock to Wives, and Births out of Wedlock to Spinsters and Widows.

	Enumerated in 1851.				BIRTHS REGISTERED in the Five Years 1849-53.		Average Annual Proportion of Births IN <i>Wedlock</i> to 100 Wives of the Ages		Average Annual Proportion of Births OUT OF <i>Wedlock</i> to 100 Spinsters and Widows of the Ages	
	WIVES of the Ages		SPINSTERS and WIDOWS of the Ages		In <i>Wedlock</i>	Out of <i>Wedlock</i>	15-40	15-55	20-40	15-55
	15-40	15-55	20-40	15-55						
England and Wales	1,630,456	2,553,894	1,248,182	2,449,669	2,819,964	203,885	34·591	22·084	3·267	1·665
France - -	3,252,746	5,603,781	2,382,824	4,773,896	4,491,269	349,123	27·615	16·029	2·930	1·461

The Mothers of all the children born are included in the Women of the ages 15-55, and a large proportion—about seven-eighths—of the mothers, are 15 and under 40 years of age. Hence the number of children born alive has been divided by the numbers of women of those ages.

The last four columns of the Table may be read thus:—To every 100 WIVES in England and Wales of 15 and under 40 years of age the proportional number of all children born alive annually was nearly 35, in France nearly 28; or every 100 wives of the ages 15-55 gave birth to 22 children in England and Wales, and to only 16 in France. To every 100 SPINSTERS AND WIDOWS of the age 20-40 there were 3·267 children born alive *out of Wedlock* in England and Wales, and 2·930 in France.

* Article by M. Legoyt in *Annuaire de l'Economie Politique*, 1857.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

* The Districts are collections of contiguous Parishes or Places, combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts are arranged according to their local position under the Registration Counties.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1855—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 625 in number are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal Public Institutions situated in the Districts of London see pages 83-4.

Note. - Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths were, in fact, less than the Deaths to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1855—DISTRICTS—continued.

DISTRICTS.		AREA in Statute Acres.	POPULATION, 1851.	TOTAL			BIRTHS.				DEATHS.		Excess of Births over Deaths.
				MARRIAGES.	BIRTHS.	DEATHS.	Including Illegitimate Births.		Illegitimate Births.		Males.	Females.	
							Males.	Females.	Males.	Females.

NOTE.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to another District or Union is included.

Wherever the minus sign (—) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

ENGLAND AND WALES.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 107 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a few persons, or diseases which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Thus mumps was the cause of 93 deaths (Males and Females) in the year 1855, and scarlatina of 17,221. The mortality of

CAUSES of DEATH at different Periods of Life, in the Year 1855.

scarlatina, deduced by dividing the deaths from that disease, *plus* 93, by the total population of England, will be found to differ little from the mortality from scarlatina alone. Where it is desired, partial correction however can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, glanders, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120-123.]

POPULATION, DEATHS, and RATE of MORTALITY in FRANCE in 1853 - -	188

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by WILLIAM FARR, Esq., M.D., F.R.S.

YEAR 1855.

SIR,

Cholera, which prevailed epidemically in the previous year, was fatal to few persons in the year 1855; and diarrhœa which is intimately associated with that disease grew less fatal. The diseases of the respiratory organs proved, however, unusually destructive; and upon analyzing the facts, it is found that the excess in the mortality was evidently the result of the cold weather in the winter season.

The cessation of the epidemic of cholera, and the diseases induced by the cold winter, are the great facts of the year.

The observations at Greenwich indicate some peculiarities in the meteorology of the year. The air moved on an average at the rate of 100 miles a day—more than 4 miles an hour—in the six years 1849–54; and the range was from 85 miles daily (the lowest) in 1853 to 109 miles daily (the highest) in 1850. In 1855 the wind travelled at the rate of 91 miles a day. The fall of rain was 21 inches; and the atmosphere was at $5\cdot3^{\circ}$ of dryness, for the mean temperature of the air was $46\cdot9^{\circ}$, and the dew-point was $41\cdot6^{\circ}$. The atmosphere was colder and moister than it is usually. The winter and the spring were cold. The mean temperature of the first *three months* of the year was $34\cdot1^{\circ}$; whereas the average of the six preceding winter quarters was $40\cdot6^{\circ}$. The temperature of the spring quarter was $50\cdot5^{\circ}$; which is $1\cdot4^{\circ}$ below the average of the six preceding spring quarters. The summer quarter was slightly above ($0\cdot3^{\circ}$), the winter quarter below ($1\cdot9^{\circ}$) the average. The price of food was high during the year; wheat was at 74s. 8d. a quarter; and in the London wholesale markets by the carcase beef was $5\frac{5}{8}$ d., mutton $5\frac{6}{8}$ d. a pound; potatoes were 101s. a ton. Trade was active during the year, although the nation was at war with Russia. All these elements which affect the means of subsistence, and the air in which the people live, exercise considerable influence on their fatal diseases.

I. CAUSES OF DEATH.

The causes of 5905 deaths were left unspecified; and of the causes of 4139 deaths no further information was obtained, than either that the deaths were sudden, or that they were inquired into at inquests, without arriving at any definite results.

I now proceed to notice briefly the *causes* of 415,659 deaths which were returned in the year.

(1.) *Zymotic diseases:—Zymotici.*

84,596 persons died of zymotic diseases. The number is less by 28,980 than the deaths from the same class in the previous year (1854). These diseases were the causes of 20 in every 100 deaths; or of 46 deaths out of 10,000 living in the year.

Small-pox killed 2525 persons. The deaths by this disease were 6903 in 1848, and 4644 in 1849; they rose to 7320 in 1852, and in the three following years fell to 3151, 2808, and 2525. The recent improvement is partly referrible to legislation, which by making vaccination gratuitous, and by other arrangements, has tended to diffuse this salutary antidote to a deadly poison. By still better arrangements small-pox may be almost exterminated, and its attacks may be rendered so mild and so infrequent, as to be very rarely a cause of death.*

Like small-pox, the following diseases are chiefly fatal to young children. Measles was fatal to 7354, scarlatina to 17,314, hooping-cough to 10,185

* See the official papers on vaccination and the able report of J. Simon, Esq., F.R.S., of the Board of Health.

persons. Thus of three of these four diseases, which occur only once in life as a general rule, 34,853 died, while 2525 died of small-pox.

Croup was fatal in 4419 cases, thrush in 1149 cases; 12,770 deaths from diarrhœa are recorded, 1437 from dysentery, and 837 from cholera, or 15,044 in the aggregate from the three causes. The deaths in 1854 from diarrhœa were 20,052, dysentery 1943, cholera 20,097, or 42,092 in the aggregate. Under these three heads the decrease of deaths was 27,048.

Dysentery and cholera are entirely different diseases, yet in their milder forms both of these types become indistinct, and are called diarrhœa,

TABLE (1).—CAUSES OF DEATH registered in ENGLAND in each of the Eight Years 1848—1855.

particularly in young children and old people. It will be observed that in the two years the deaths from diarrhœa fell from 20,052 to 12,770; while the deaths from cholera fell from 20,097 to 837. The severe convulsive form of the epidemic almost disappeared.

Influenza grew more fatal. 3568 deaths are referred to this catarrhal affection, which in no year since 1848 had been so fatal. And undoubtedly many of the deaths registered under bronchitis and pneumonia belong properly to influenza.

Typhus was fatal in 16,032 instances. The mortality under this head, including all the forms of common continued fever, was below the average.

TABLE (1).—CAUSES OF DEATH registered in ENGLAND in each of the Eight Years 1848—1855—*continued*.

CAUSES OF DEATH.	1848	1849	1850	1851	1852	1853	1854	1855

Metria and erysipelas were more fatal than they were in the four previous years. Rheumatic fever terminated fatally in 1046 cases.

Fourteen persons died of hydrophobia in England.

(2.) *Constitutional Diseases: Cachectici.*

The deaths by causes under this head amount to 87,787. The deaths are 21 per cent. of the total deaths, and these diseases destroyed in the year 47 out of every 10,000 of the population.

TABLE (2).—ENGLAND. CAUSES OF DEATH. To 1,000,000 PERSONS LIVING, the DEATHS from each Class of Causes, and from each Cause, in the Years 1853, 1854, and 1855.

CAUSES OF DEATH.	Deaths to 1,000,000 Persons living.			CAUSES OF DEATH.	Deaths to 1,000,000 Persons living.

The Table may be read thus: In 1855 to every 1,000,000 Persons living there were 22,659 deaths from All Causes (nearly 23 in 1000); 136 deaths from small-pox; 397 from measles; 935 from scarlatina, and so on.

The diathetic diseases of uncertain or variable seat (*de incertis sedibus*) caused 20,267 deaths, including 9362 by dropsy (which is often the result of heart disease or nephria), 6016 by cancer, and 1282 by mortification. The diagnosis of internal cancer is now better understood than it was; and to this, probably, the increase of cases of cancer since 1848 must be partly referred.

TABLE (3).—ENGLAND. CAUSES OF DEATH. To every 1,000,000 *Deaths from All Causes*, the proportional Numbers from each Class of Causes, and from each Cause, in the Years 1853, 1854, and 1855.

CAUSES OF DEATH.		Proportional Number to 1,000,000 Deaths.		
		1853	1854	1855
ALL CAUSES - - -		1,000,000	1,000,000	1,000,000

The 67,520 deaths from tubercular diseases include 2985 from scrofula, 4762 from tabes mesenterica, 7483 from hydrocephalus, and 52,290 from phthisis.

(3.) *Local Diseases: Monorganici.*

164,812 persons died of the inflammations and other simple local affections of particular organs. As their primary seat is often in one organ of the body they have been designated monorganic diseases. They include 39 per cent. of the total deaths; and of them 89 in 10,000 people living died.

The diseases of the four great systems of organs are the principal causes of the deaths in the group.

Thus to the affections of the nervous system 52,901 (nearly 13 in 100) of the deaths are due, including 3466 from inflammations of the brain and its membranes (cephalitis), 8645 from *apoplexy*, and 8905 from *paralysis*, including the various degrees of *ramolissement* of the brain (necrencephalus), 2136 deaths from epilepsy, and 24,917 deaths from convulsions. The latter form of death is chiefly fatal in infancy, for of the 24,917 the children under one year are 20,457.

Apoplexy and paralysis infest persons of advanced ages. Hydrocephalus, in the class of scrofulous and tubercular diseases, was fatal in 7483 cases. Deaths of insane persons are generally registered under their other fatal diseases.

14,552 (or more than 3 in 100) deaths are referred to the class of diseases of the heart and large blood vessels; to which also many of the 9362 deaths by dropsy properly belong as their primary sources. The deaths by aneurism fluctuate little; 307 in 1848, they amounted to 312 in 1855. If the cases of dropsy and all heart diseases are taken together the mortality will be at the rate of 13 in 10,000 living.

63,742 deaths happened from diseases of the respiratory organs, or 15 in 100 of the total deaths; being a mortality at the rate of 34 in 10,000. The two great fatal diseases of the class are bronchitis 27,182, pneumonia 26,052; and it is probable that many of the latter cases belong properly to bronchitis, for pathologists have recently shown that what was once called lobular pneumonia is bronchitis with obstruction of some branches of the air-tubes, leading to contraction of the connected pulmonary vesicles. This doctrine is well established, but it has not yet penetrated the minds of all classes of practitioners, or, at least, it had not greatly influenced their diagnosis in 1855. If to avoid such errors we group together the deaths from bronchitis, pleurisy, and pneumonia, they will amount to 54,387 in the year 1855, against 44,540 in 1854 and 37,363 in 1848. The deaths from all the diseases of the class were 63,742 in 1855, 52,484 in 1854, and 44,795 in 1848; thus there was a great excess of deaths in 1855 from diseases of the respiratory organs.

The deaths from phthisis, which is in the tubercular class, remained nearly stationary during the eight years; 51,663 persons died from phthisis in 1848, and 52,290 in 1855.

The diseases of the digestive organs proved fatal in 23,091 cases; causing 5.5 in 100 deaths, and killing 12 in every 10,000 of the population.

Teething is one of the metamorphic changes of the organization; and is attended in many children with disorders of various kinds, which may be explained on Dr. Marshall Hall's theory of reflex nervous action. As teething may be held to be essentially a physiological act, it is contended by some that it cannot, therefore, be a cause of death. That act, however, in a certain number of cases, becomes pathological, and is accompanied by remote diseased action,—coming and going with the different stages of teething;—it may be simply inflammation of the gums, or it may be diarrhoea, effusion on the brain, convulsions. Sometimes these are idiopathic affections, supervening while this process is going on, and sometimes also they evidently owe their origin to the teething. The common notion that teething is

sometimes a cause of death is true in the same sense as it is true that childbirth, also essentially a physiological act, is sometimes a cause of death. The number of deaths returned under teething in the year 1855 was 4057, which is less than the average number. 810 deaths are referred to gastritis, 3225 to enteritis, and 1388 to peritonitis, or 5423 to the three inflammations. The inflammations of the air-passages and lungs (laryngitis, bronchitis, pleurisy, pneumonia,) were ten times as fatal (deaths 55,542) as the corresponding inflammations of the intestinal canal. If diarrhoea and dysentery are added to the abdominal inflammations the deaths will amount to 19,630; which will still fall short of the pulmonary inflammations, amounting with influenza to 59,110.

Of ascites 836 persons died, of ulceration of the intestines 876, hernia 874, ileus 1188, intus-susception 243, and stricture of the intestinal canal 233. It will be observed that these diseases fluctuate little from year to year.

5 deaths are referred to disease of the pancreas; 6566 to hepatitis, jaundice, and disease of the liver; and 54 to disease of spleen.

4196 deaths by diseases of the urinary organs are recorded, including 244 by nephritis, 793 by nephria (Bright's disease), 448 by diabetes, 234 by stone, and 278 by cystitis. Stricture of the urethra was fatal in 218 cases, which must have been primarily cases of gonorrhoea, one of the zymotic diseases. The mortality from diseases of the urinary organs was 2 in 10,000 living, or they caused *one* in every 100 deaths.

3003 deaths are referred to childbirth and gennetic diseases, 61 to paramenia, 208 to ovarian dropsy, 834 to various diseases of the uterus, &c., and 1900 to childbirth. If we add the 1079 deaths by metria (puerperal fever), which attacks women in childbirth, the total deaths in that state will amount to 2979. The number of children born alive was 635,043; so to every 10,000 children born alive 47 mothers died in childbirth. The mortality is much less than it was in previous years, and it is as low as it was in the year 1854; but by judicious sanatory arrangements the number of these deplorable deaths may be greatly diminished.

One mother dies to 213 children born alive, and *one* to 219 childbearings.*

2552 deaths are from diseases of the *organs of locomotion*, 80 from arthritis (inflammation of the joints), 1124 from rheumatism, and 1348 from diseases of the joints. Only 6 in 1000 deaths fall under this head; the mortality being somewhat more than 1 in 10,000 living.

775 deaths are from diseases of the integumentary system, 255 from carbuncle, 255 from phlegmon, and 265 from various diseases of the skin. Nearly 2 deaths in 1000 are thus caused; and the annual rate of mortality is less than 1 (it is 0.4) in 10,000 living.

What a contrast this presents with the mortality of the middle ages from leprosy and other cutaneous epidemics! And the difference is the consequence of better clothing, better food, and of increased cleanliness.

(4.) *Developmental Diseases: Metamorphici.*

It sometimes happens that important parts of the human fabric are imperfectly made; and although the children are born alive, they die in the first year of life in great numbers, while a few survive and die off even at advanced ages. The deaths from malformations in the year were 916; and of that number 300 were from cyanosis, 247 from spina-bifida, and 369 from other malformations.

Other children are born before the nine months of their evolution is complete, and although a few children of six, seven, and eight months are

* In a certain number of cases twins and triplets are born; and the deaths of mothers of stillborn children (not registered) are referred to metria or childbirth. In my last letter it was shown, that the *children born alive multiplied* by 1.02531 = childbearings nearly.

reared, great numbers of them die, and are classed under *premature birth*. Other infants of full term are weakly, and their deaths are referred by the medical informants simply to debility. The same name is sometimes applied to the deaths of adults; but such deaths are in some instances referred to "atrophy" in the Tables. 17,818, or 4 in every 100 deaths, are ascribed to premature birth and debility, making nearly 10 such deaths annually to 10,000 persons living. Teething and childbirth properly belong to this group, but they have already been discussed. Of atrophy,—wasting away without any discovered disease,—14,724 persons died, making 3.5 in every 100 deaths, and 8 such deaths annually to 10,000 persons living.

29,714 persons died of old age, or 7 in every 100 of the total deaths. Thus only *one* in every *fourteen* had attained this termination of life. Of 10,000 living, 16 died of old age.

(5.) *Violent Deaths:—Thanatici.*

Death is often the result of external causes; and in a certain number of cases those causes are evident, as they kill by violence.

The deaths in this class amounted to 13,551 in the year 1848, and to 15,292 in 1855.

Persons die by intoxication, by the want of food, by the neglect, when they are young or old, of their natural guardians, and by exposure to cold. To the 286 deaths ascribed by the informants to intemperance, 536 deaths by delirium tremens should be added, making 822 by *alcoholism*, besides many other deaths by secondary diseases; 91 died for want of food; 850 infants for want of their natural nourishment, breast-milk; 36 from neglect. The severity of the cold is shown by the 195 deaths from that cause, which in the previous seven years was never fatal directly to more than 107 persons in one year. It has been shown that cold, by inducing bronchitis and other diseases, was the remote cause of a multitude of deaths in 1855.

The deaths by poison were 380; to which they have been reduced from 467 in the year 1848. Arsenic is not obtained so easily as it was formerly, but these dreadful deaths are still too common, and may be still further reduced by judicious legal enactments. Society can thus in many cases prevent murder, suicide, and accidental death.

Burns and scalds were more fatal than they were in any previous year. Of them 2590 persons died in 1853, 2755 in 1854, and 3177 in 1855. The cold led to an increase in the consumption of coal; people approached nearer to the fire than in ordinary years, and the cold was thus the indirect cause of probably more than four hundred deaths by burns.

The deaths by hanging and suffocation were 1314, the deaths by drowning 2472.

The forces employed in works, in mines, in manufactures, in travelling, increase every day faster than the means of protecting life against the injuries which they inflict. Hence the deaths by fractures and contusions were 4228 in the year 1848, and rose progressively to 5468 in the year 1855. This increase demands inquiry.

617 persons died of cuts, stabs, and wounds.

406 persons died of violence in forms not fully specified.

The deaths have thus been passed rapidly in review, and their causes have been pointed out in their several orders.

The causes of death are arranged in the order of their fatality in Table (4). It is there seen that consumption is by far the most fatal of all causes; and that, exclusive of old age, bronchitis and pneumonia stand next in order. 25 per cent. of the deaths, or one fourth part of the mortality, is referred in the returns to these *three* causes. Another 25 per cent. of the deaths are referred to old age, convulsions, premature birth and debility, scarlatina, and typhus. Thus the *half* of the mortality is

wrought by eight causes. 77 in every 100 deaths are classed under the first twenty heads in this Table. Hydrophobia and disease of the pancreas are the causes of the fewest deaths.

The liability to diseases at the various periods of life possesses great practical interest to the pathologist in the study of morbid changes, and to the physician who seeks to ward off their inroads.

The Tables (pp. 120—142) present a mass of information on this important subject, such as has never before been published in any country. After they have been subjected to various calculations, I hope to be able to bring under your notice some of their interesting results.

I have the honour to be,

Sir,

Your obedient and humble servant,

The Registrar General.

WILLIAM FARR.

TABLE (4)—ENGLAND. CAUSES OF DEATH in the Year 1855, arranged in the order of Mortality.

CAUSES OF DEATH.	Number of Deaths registered in the Year 1855.	Proportional Number from each Cause to 1,000,000 Deaths from All Causes.*	CAUSES OF DEATH.	Number of Deaths registered in the Year 1855.	Proportional Number from each Cause to 1,000,000 Deaths from All Causes.*

The Population at each age, as given in the “Statistique de la France, deuxième série, tome II. pp. 260-1,” has here been corrected for *increase*, on the assumption that the increase has been uniform at every age, and that the same rate of increase has taken place *since* 1851 as was observed between 1846 and 1851. The Deaths are taken from the “Statistique de la France, deuxième série, tome III. (1^{re} partie), pp. 31-39.” A correction has been made both in Population and Deaths for Ages not stated.. Those numbers have been distributed over the numbers against the various ages. According to M. Legoyt, some of the young children under 5 years of age escaped enumeration.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]
